The screenshot shows a Jupyter Notebook interface with a menu bar (File, Edit, View, Insert, Cell, Kernel, Widgets, Help) and a status bar (Not Connected, Not Trusted, Python 3 (ipykernel)). The notebook content includes a section titled "Model Evaluation" with explanatory text and two code cells. The first code cell (In [126]) defines an XGBRegressor model, fits it to training data, predicts on validation data, and prints the RMSLE value. The second code cell (In [127]) defines a Lasso model, fits it to training data, predicts on validation data, and prints the RMSLE value.

```
In [126]: XG = XGBRegressor()
XG.fit(X_train, y_train)
y_pred = XG.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSLE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSLE: 70.06429878638917

In [127]: L = Lasso()
L.fit(X_train, y_train)
y_pred = L.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSLE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSLE: 128.9558620089095
```

The screenshot shows a Jupyter Notebook interface with a menu bar (File, Edit, View, Insert, Cell, Kernel, Widgets, Help) and a status bar (Not Connected, Not Trusted, Python 3 (ipykernel)). The notebook content includes four code cells, each defining a different regression model, fitting it to training data, predicting on validation data, and printing the RMSLE value.

```
In [128]: EN = ElasticNet()
EN.fit(X_train, y_train)
y_pred = EN.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics

Model Evaluation

We're going to use `x_train` and `y_train` obtained above in `train_test_split` section to train our regression model. We're using the `fit` method and passing the parameters as shown below. Finally, we need to check to see how well our model is performing on the test data.

Regression Evaluation Metrics: RMSE: Root Mean Square Error RMSE is the square root of the averaged squared difference between the target value and the value predicted by the model. It is preferred more in some cases because the errors are first squared before averaging which poses a high penalty on large errors. This implies that RMSE is useful when large errors are undesired.

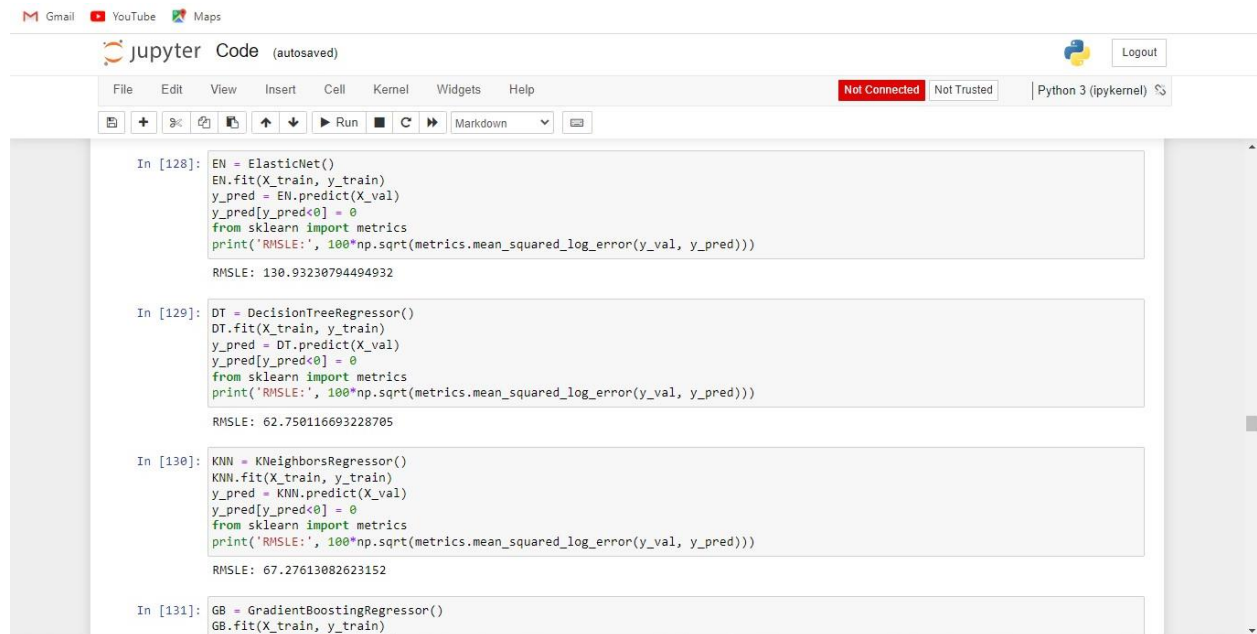

For testing the model we use the below method,

```
In [126]: XG = XGBRegressor()
XG.fit(X_train, y_train)
y_pred = XG.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSE: 70.06429878638917
```

```
In [127]: L = Lasso()
L.fit(X_train, y_train)
y_pred = L.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSE: 128.9558620089095
```

Model Evaluation

```
In [128]: EN = ElasticNet()
EN.fit(X_train, y_train)
y_pred = EN.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSE: 130.93230794494932
```

```
In [129]: DT = DecisionTreeRegressor()
DT.fit(X_train, y_train)
y_pred = DT.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))

RMSE: 62.750116693228705
```

```
In [130]: KNN = KNeighborsRegressor()
KNN.fit(X_train, y_train)
y_pred = KNN.predict(X_val)
y_pred[y_pred<0] = 0
from sklearn import metrics
print('RMSE:', 100*np.sqrt(metrics.mean_squared_log_error(y_val, y_pred)))
